1 Problem Statement

Given a digital elevation model (DEM) of Earth's surface, we need a domain of point coordinates in three dimensions suitable for solving partial differential equations on. The domain extends downward from the DEM surface to a user-defined desired depth.

2 Requirements

2.1 Inputs

Data to be supplied by the user are:

- a digital elevation model (m above mean sea level) covering the desired area e.g. a GTOPO30 tile,
- longitude and latitude intervals (in degrees easting and northing),
- a desired depth (m).

2.2 Outputs

Data to be output by the program are three tab-delimited .txt files containing the separate (x, y, z)-coordinates of a computational grid spanning the longitude and latitude limits and down to the desired depth.

3 Architecture

3.1 Class Descriptions

3.1.1 Point

Data members are three doubles that constitute an (x, y, z)-coordinate. Public routines are getters, setters, and a `showCoordinate()` function, which displays the coordinate of the point in the terminal.

3.1.2 Line

Data members are an integer size `N` indicating the number of points in the line, and `coordinates`, a dynamically-allocated (size `N`) array of `Point` objects. Points are added to the line by means of a function `addPoint(int i, Point p)`, which inserts the Point `p` into `coordinates` at index `i` (the first element having index 0). Public routines are `addPoint(int i, Point p)` and `showCoordinates()`, which displays all the coordinates in the line in the terminal.

3.1.3 Surface

3.1.4 Domain

3.2 Mathematics

3.2.1 2D Transfinite interpolation

$$\begin{aligned} x(\xi,\eta) =& (1-\xi)x(0,\eta) + \xi x(1,\eta) + (1-\eta)x(\xi,0) + \eta x(\xi,1) - (1-\eta)(1-\xi)x(0,0) \\ & - \xi(1-\eta)x(1,0) - (1-\xi)\eta x(0,1) - \eta\xi x(1,1), \end{aligned}$$

$$\begin{aligned} y(\xi,\eta) =& (1-\xi)y(0,\eta) + \xi y(1,\eta) + (1-\eta)y(\xi,0) + \eta y(\xi,1) - (1-\eta)(1-\xi)y(0,0) \\ & - \xi(1-\eta)y(1,0) - (1-\xi)\eta y(0,1) - \eta\xi y(1,1). \end{aligned}$$

3.2.2 3D Transfinite Interpolation

As in [1], the formula for 3D transfinite interpolation is as follows:

$$\begin{aligned} U(\xi,\eta,\zeta) &= (1-\xi)X(0,\eta,\zeta) + \xi X(1,\eta,\zeta), \\ V(\xi,\eta,\zeta) &= (1-\eta)X(\xi,0,\zeta) + \eta X(\xi,1,\zeta), \\ W(\xi,\eta,\zeta) &= (1-\zeta)X(\xi,\eta,0) + \zeta X(\xi,\eta,1), \\ UW(\xi,\eta,\zeta) &= (1-\xi)(1-\zeta)X(0,\eta,0) + \zeta(1-\xi)X(0,\eta,1) \\ &\quad + \xi(1-\zeta)X(1,\eta,0) + \xi\zeta X(1,\eta,1), \\ UV(\xi,\eta,\zeta) &= (1-\xi)(1-\eta)X(0,0,\zeta) + \eta(1-\xi)X(0,1,\zeta) \\ &\quad + \xi(1-\eta)X(1,0,\zeta) + \xi\eta X(1,1,\zeta), \\ VW(\xi,\eta,\zeta) &= (1-\eta)(1-\zeta)X(\xi,0,0) + \zeta(1-\eta)X(\xi,0,1) \\ &\quad + \eta(1-\zeta)X(\xi,1,0) + \eta\zeta X(\xi,1,1), \\ UVW(\xi,\eta,\zeta) &= (1-\xi)(1-\eta)(1-\zeta)X(0,0,0) + (1-\xi)(1-\eta)\zeta X(0,0,1) \\ &\quad + (1-\xi)\eta(1-\zeta)X(0,1,0) + \xi(1-\eta)(1-\zeta)X(1,0,0) \\ &\quad + (1-\xi)\eta\zeta X(0,1,1) + \xi(1-\eta)\zeta X(1,0,1) \\ &\quad + (1-\zeta)\xi\eta X(1,1,0) + \xi\eta\zeta X(1,1,1). \end{aligned}$$

Putting these together gives the complete formula:

$$\begin{aligned} X(\xi,\eta,\zeta) = & U(\xi,\eta,\zeta) + V(\xi,\eta,\zeta) + W(\xi,\eta,\zeta) \\ & - UW(\xi,\eta,\zeta) - UV(\xi,\eta,\zeta) - VW(\xi,\eta,\zeta) \\ & + UVW(\xi,\eta,\zeta). \end{aligned}$$
